

Software Engineering COMP1035

Lecture 01

Introduction

Schedule

Aims of the module.

What is the “Software” we are talking about.

The need for SE.

Overview of SE process.

Plan for the semester.

Aims of the Module

What is Module Specification?

- Summary of content: You'll be introduced to the concept of Software Engineering and will be taken through the software development process:
 - deciding exactly what should be built (**Requirements**),
 - designing how it should be built (**Software Specification/Architecture**),
 - development strategies (**Implementation & Testing**), and
 - maintaining change (**Software Evolution and Maintenance**).
- An aim of this module is to provide a general understanding of Software Engineering; the typical phases of the **software lifecycle** with reference to practical Requirements and Specification, Software Design, and Implementation & Testing techniques. It serves to prepare students for the various software development projects undertaken throughout their studies.

COMP1035 (FSE) Aims

1. Teach you an ***overview** of the **whole** Software Engineering process.
2. Give you initial **practical experience** of work at different stages of the process.
3. **Prepare you** for Software Engineering group project in Part 1 year.

(Note: We **cannot teach you everything** in a 10 credits module)

What is the “Software” We are
Talking About?

What is Software?

- Such that it needs a big process.
- You largely did not build software in semester 1 – you wrote code.
- Bigger software examples:
 - A phone game app, with a global scoreboard
 - Twitter software
 - Google Chrome
 - Universal Credit System for Benefits (for Government)

What is Software?

- Last semester, you built dedicated scripts to achieve one thing!
- A **component** of software.
- Not ready for 'real human' use.
- Probably was buggy.
- Software is something that is working, usually for 'real humans' to use to help them do something.

Scripts

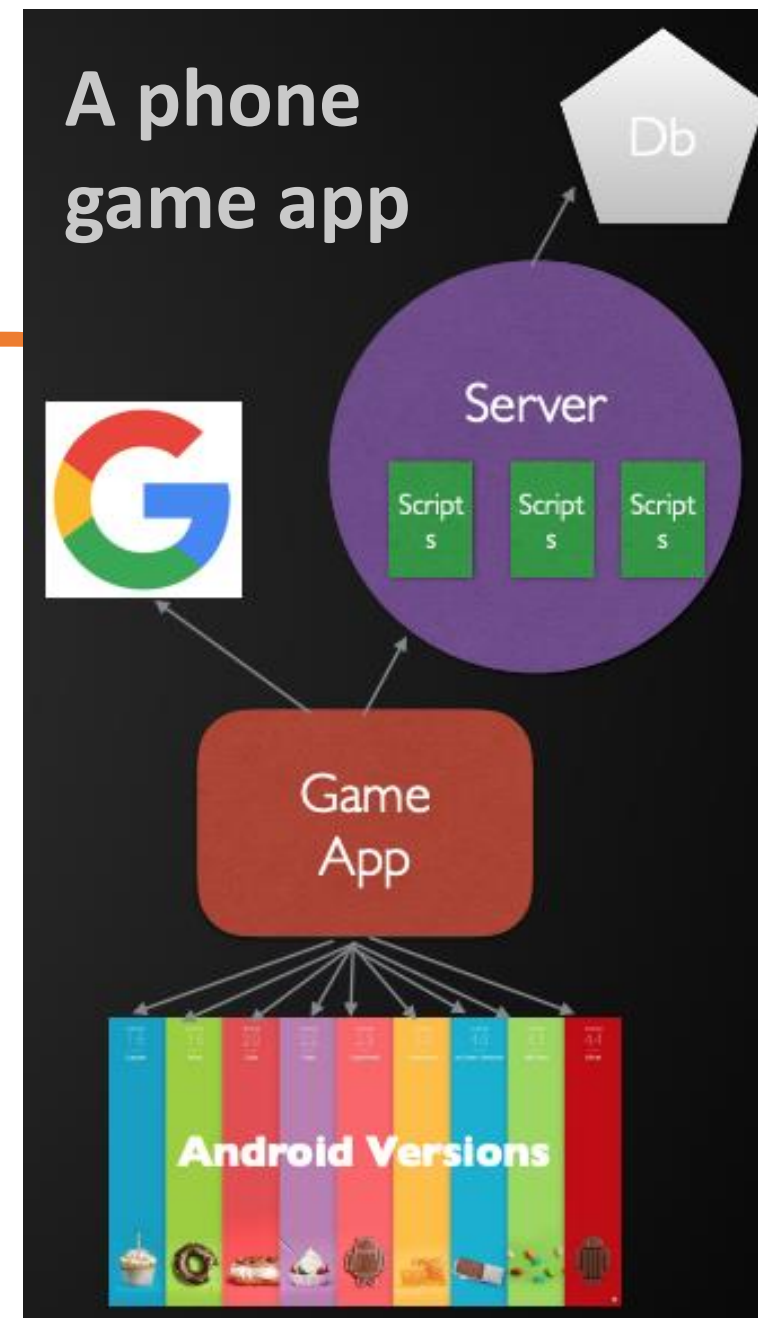

Scripts

Scripts

Scripts

What is Software?

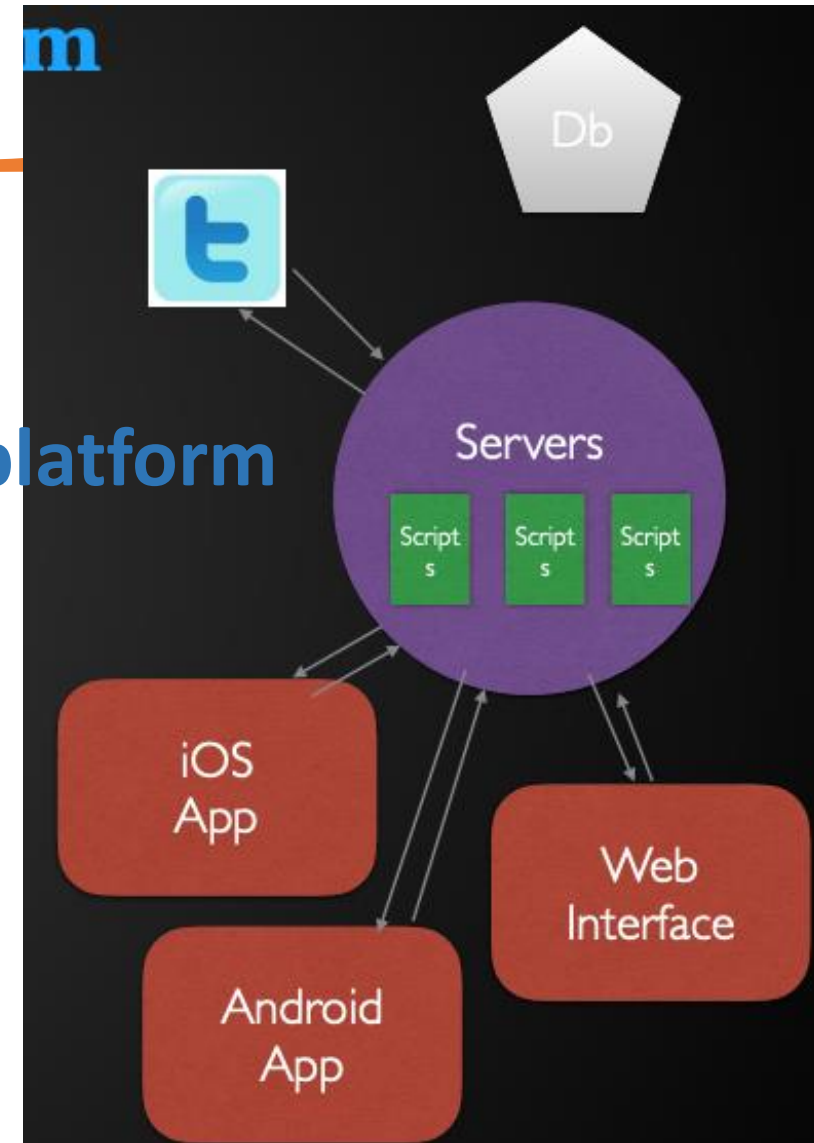

- Ready for real users.
- Integrates many features in the game.
- Might integrate with other services (e.g., login).
- Might have a server component.
 - Talking to a database.
- Need to push out multiple versions.

What is Software?

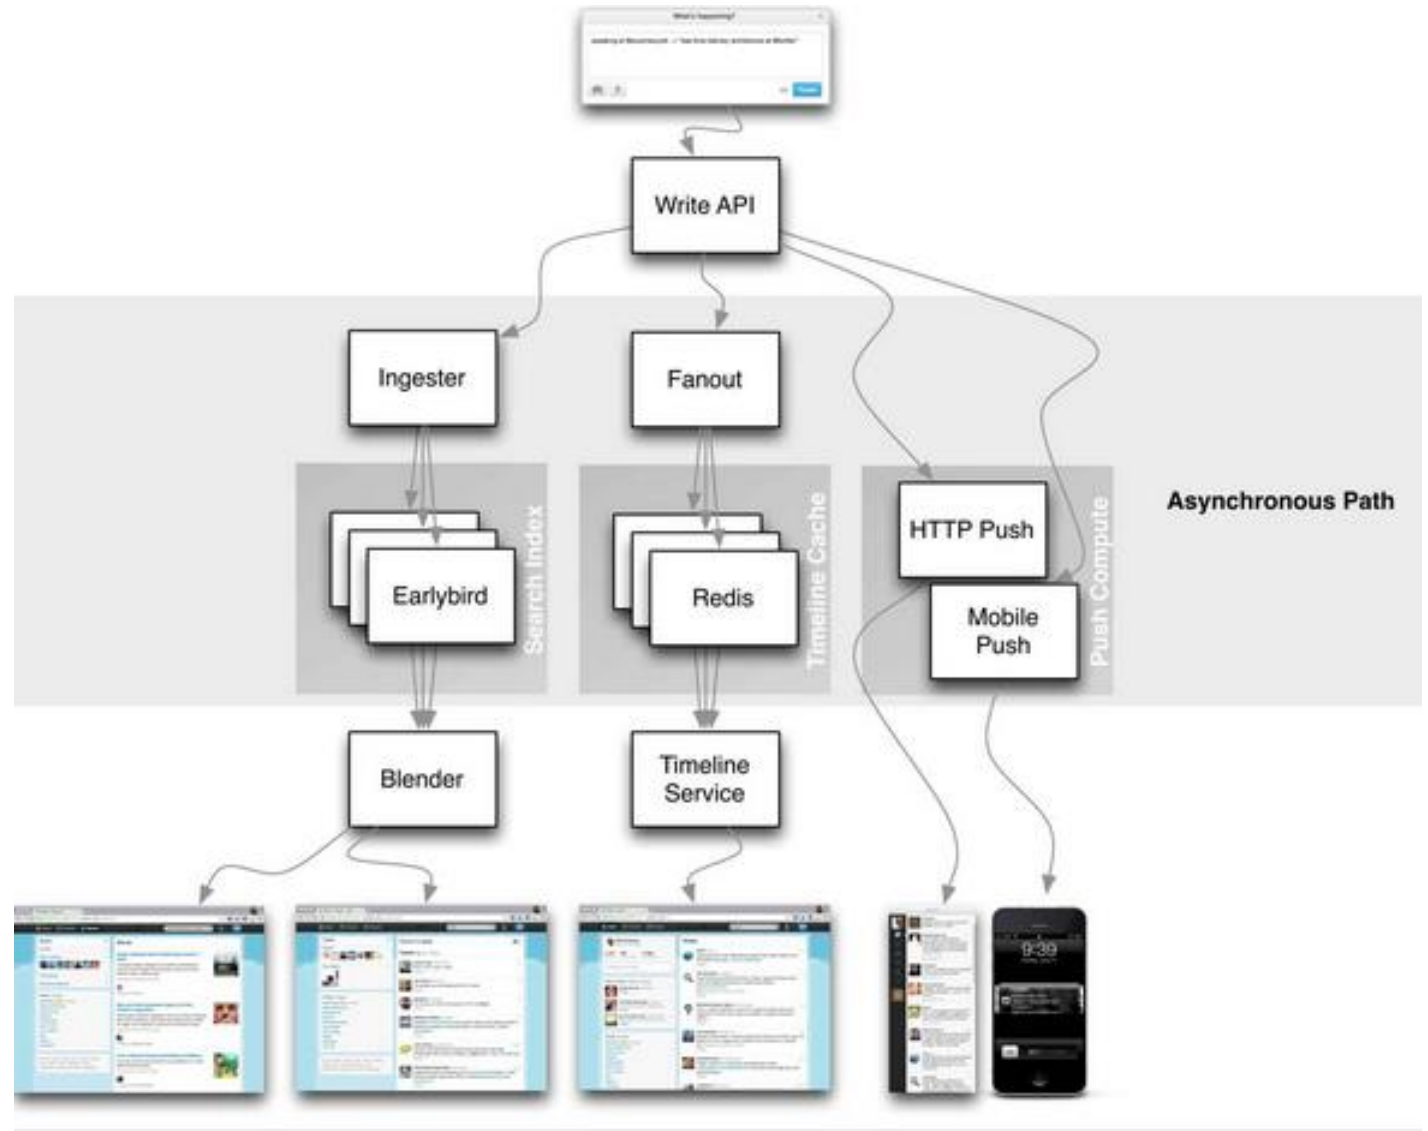

- Let's ignore issues of scale for now.
 - Pretend '1 database' is ok.
- Basically, a server driven platform.
- Has a lot interfaces to it.
 - Each is a piece of software.
 - Each one integrates functions.
 - Each piece might have different bugs.
- New features rolled out across them.

A social media platform

Interest Reading: Twitter's Own Diagram

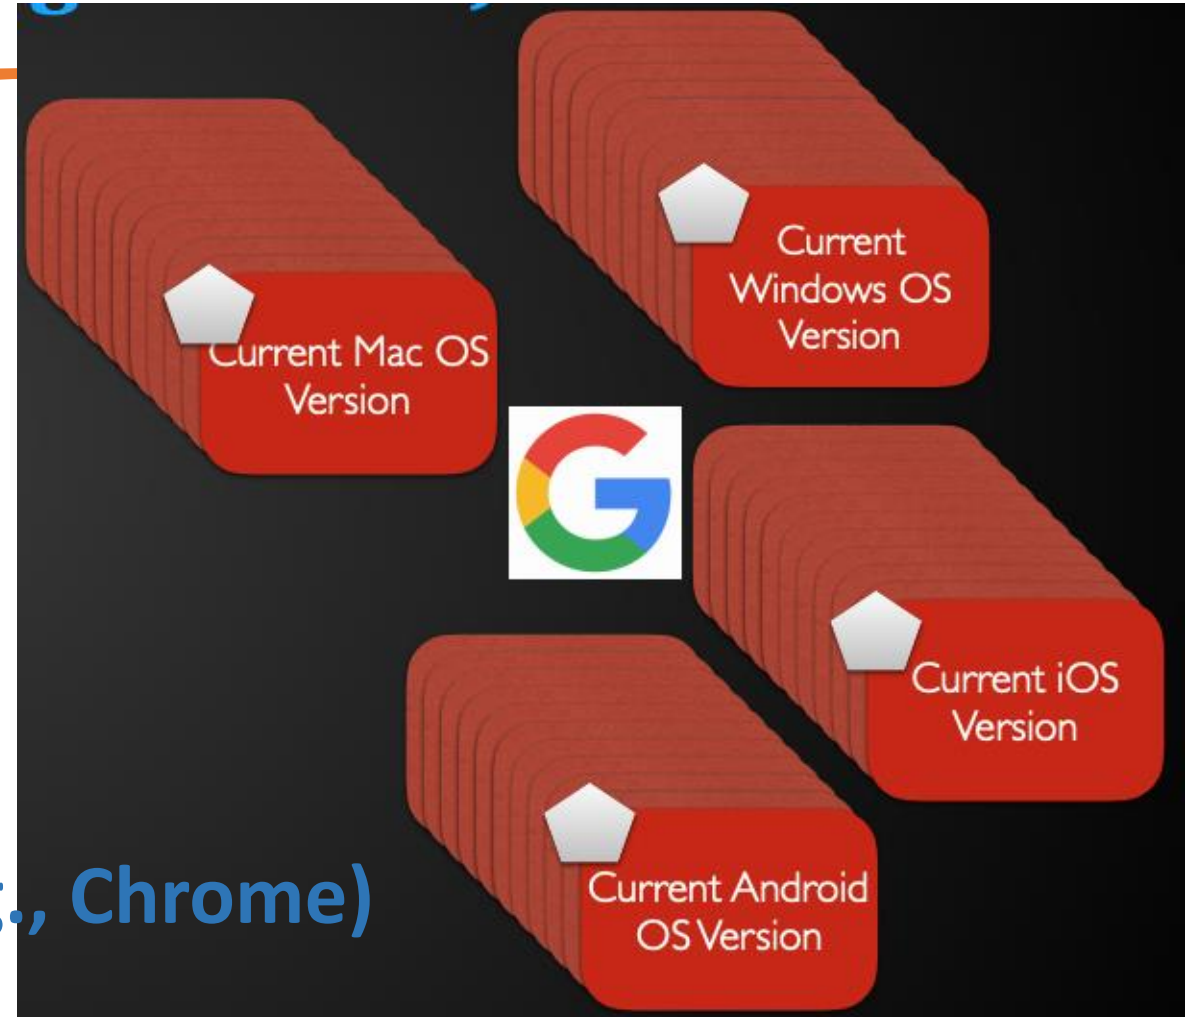

- Video of Twitter Scale:
<https://www.infoq.com/presentations/Twitter-Timeline-Scalability/>

What is Software?

- Integrate multiple functions.
- Has a version history on every platform.
- New functions roll out on all platforms.
- All authenticate and share data.

A web browser (e.g., Chrome)

What is Software?

- Government service to handle benefits payments.
- Integrate 6 existing systems.
- Process millions of users.
- Be used at job centres – across UK.

UK Universal Credit (Benefits) Software

UoN Campus Solution (Simplified)

- In 2015 – UoN wants to buy a software package to handle student records – merge 4 different systems
 - Student records.
 - Module enrolment.
 - Admissions.
 - Course documentation.
- To use on all 3 campuses (UK, Malaysia, Ningbo China).
- They have brought this from a software company.

UoN Campus Solution (Simplified)

- **Phase 1** – Admission starts across all 3 sites in 2016.
- **Phase 2** – Went live in Malaysia in January 2017.
- **Phase 3** – Full development due January 2018 – Ningbo China goes ahead with all data managed in both old and new systems.
 - UK delayed till April 2018.
 - UK delayed till Summer 2018 (still managing data in both old & new).
 - UK delayed until Christmas 2018.
 - January 2019 – Went live in UK (data still managed in old system, just in case).
- **Phase 4** – Finance part of the system going ahead in 2019/20!

Testing of Campus Solutions

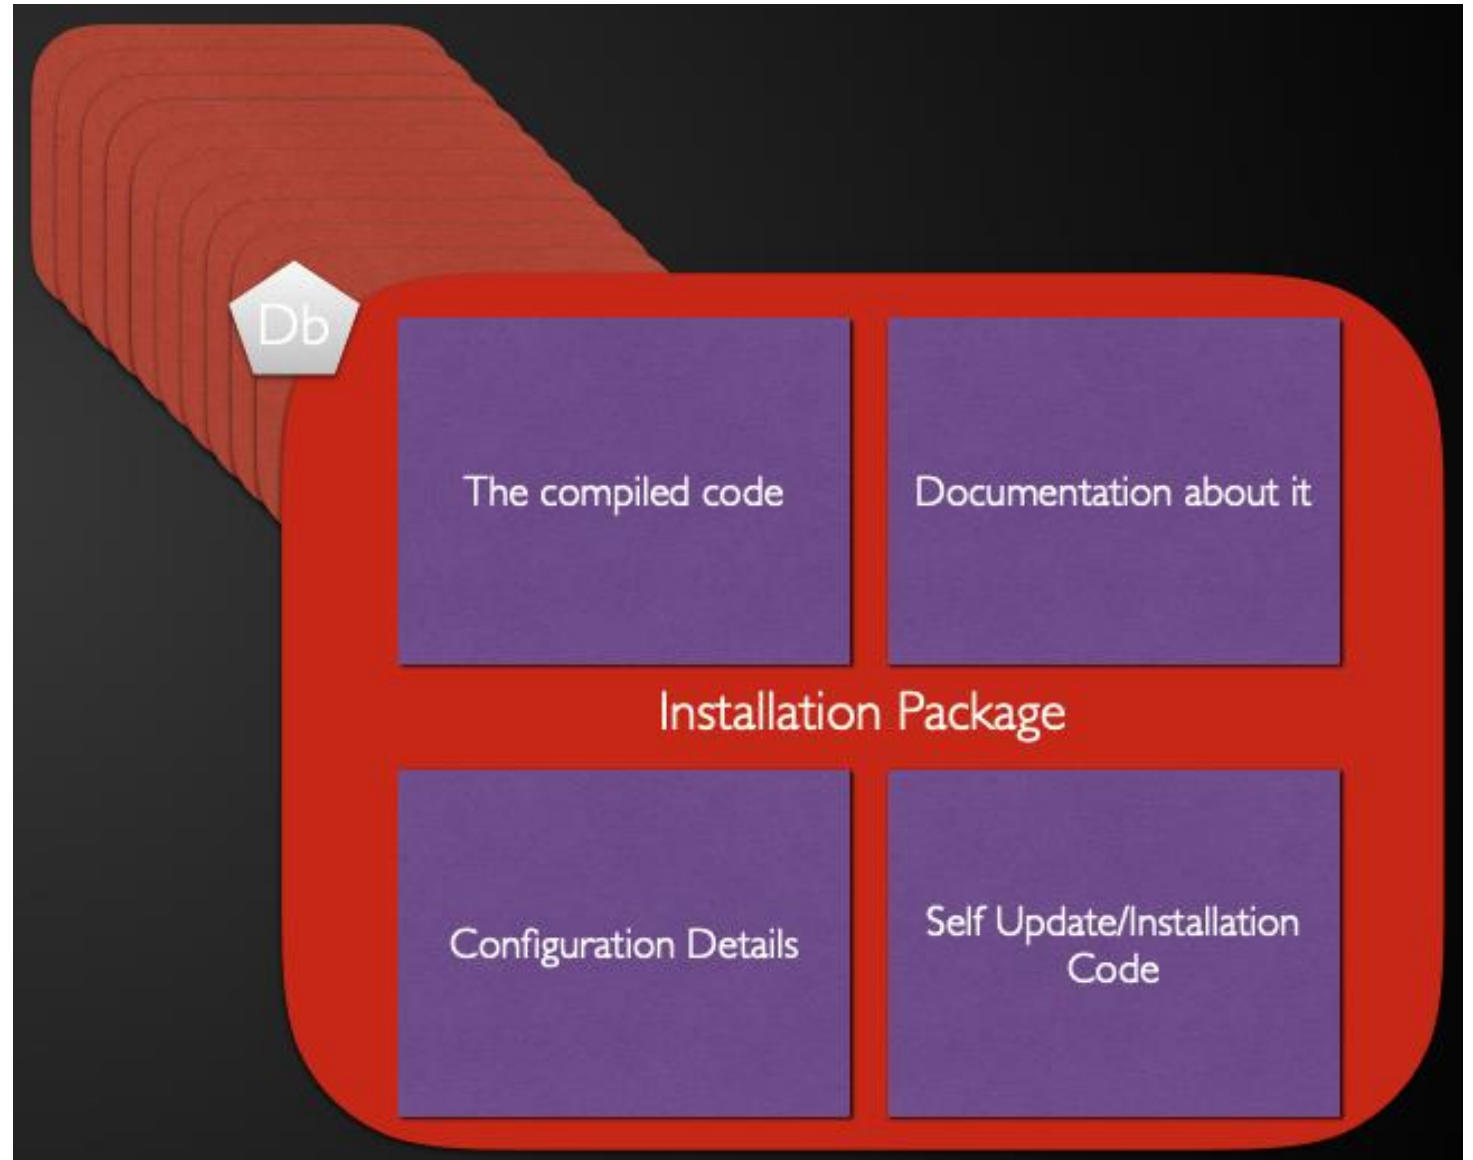

- <http://blogs.nottingham.ac.uk/campus-solutions/2018/10/24/overview-of-campus-solutions-testing-procedure/>

Here is an insight into the comprehensive testing steps that the team are working through:

1. **Unit Testing** – In this initial test, the code, configuration, Oracle functions, data handling and security of the functionality are reviewed and tested by the developer.
2. **Functional Acceptance Testing (FAT)** – This involves analysing the original requirements and running tests to make sure each of them has been delivered by the developer.
3. **Business Acceptance Testing (BAT)** – After the functionality has passed FAT, it is given to the business user for them to run tests on how the process will be run. This is where the business checks that the functionality works as the University expects it to and nothing has been missed.
4. **End-to-end testing** – 15 different student types across the student lifecycle have been identified at the University. In this test, the functionality is tested across as many varied circumstances as possible to ensure it works with every student type. Connections and data transfers to other University systems are also tested here.
5. **Regression testing** – As new functionality is brought into the system, it is important to ensure that existing functionality continues to work. This testing stage ensures that new and existing functionality works in harmony together.
6. **Performance testing** – This assesses the performance of the functionality in terms of speed, scalability and stability. Performance testing ensures the system can cope with events such as confirmation and clearing and start of session when system usage is very high.
7. **Penetration testing** – It is important to ensure that the functionality and the system as a whole has the best security standards to withstand any malicious attacks, such as viruses or worms. The servers and network that the system will be running on are also tested. Specialist external companies are used to 'attack' the system and provide recommendations to improve security.

What is Software?

- Software includes
 - The compiled code.
 - Documentation.
 - Configuration components.
 - Installation/upgrade.
- All in an installer that 'deploys'.

What is Software Engineering?

“The application of a **systematic, disciplined, quantifiable** approach to the **development, operation** and **maintenance** of software [...];

That is, the application of engineering to
software”

- Wikipedia

(actually, gives a good definition, despite being a bad reference source)

The Need for Software Engineering

Bad Software is Frustrating

Sarah James @SarahJames456

The Software Crisis (Nato, 1968)

- Software was bad, or worse.
- Software was unreliable behind schedule and cost more than expected.
- 'Software Engineering' was coined to understand the 'making' of software.
- During the 1970s/80s (and still now) people develop new processes to better 'engineer' software.

“The average customer of computing industry has been served so poorly that he expects his system to crash all the time, and we witness a massive world wide distribution of bug-ridden software for which we should be deeply ashamed.”

- Dijkstra, 2001

Ongoing SE Project Failurees

- The global cost of IT failure was estimated at +6 trillion dollars in 2009. (source: Roger Sessions, The IT Complexity Crisis: Danger and Opportunity)
- Only 32% of software projects were “successfully completed” (i.e., on time, on cost, and with expected functionality) in 2009. (Source: Standish CHAOS 2009 Update)
- Only 16% of software projects were successfully completed in the UK in 2009. (Source: British Computer Society)
- “A failing industry ...
 - If building engineers build buildings with the same care as software engineers build systems, the first woodpecker to come along would be the end of civilization as we know it.” (Source: Paul Dorsey, Top 10 Reasons Why System Projects Fail)

Ongoing SE Project Failures

[https://en.wikipedia.org/wiki/List of failed and overbudget custom software projects](https://en.wikipedia.org/wiki/List_of_failed_and_overbudget_custom_software_projects)

The screenshot shows the Wikipedia article page for "List of failed and overbudget custom software projects". The page includes the Wikipedia logo, navigation links (Main page, Contents, etc.), and the article content. The article text states: "This article contains one or more *incomplete lists* which may never be able to satisfy particular standards for completeness. You can help by *expanding it / them* with entries that are *reliably sourced*." It then provides a list of notable custom software projects that have failed or run over budget, and a note that failed projects are not necessarily the sole fault of the employees or businesses creating the software. The page also features a table of contents with links to sections like "Permanent failures", "Temporary issues and mere budget overruns", "Projects with ongoing problems", "See also", "References", and "External links".

List of failed and overbudget custom software projects

From Wikipedia, the free encyclopedia

*This article contains one or more **incomplete lists** which may never be able to satisfy particular standards for completeness. You can help by **expanding it / them** with entries that are **reliably sourced**.*

This is a list of notable **custom software** projects which have significantly failed to achieve some or all of their objectives, either temporarily or permanently, and/or have suffered from significant **cost overruns**. For a list of *successful* major custom software projects, see [Custom software#Major project successes](#).

Note that failed projects, and projects running over budget, are not necessarily the sole fault of the employees or businesses creating the software. In some cases, problems may be due partly to problems with the purchasing organisation, including poor [requirements](#), over-ambitious requirements, unnecessary requirements, poor [contract](#) drafting, poor contract management, poor end-user [training](#), or poor operational management.

Technology

US prisoners released early by software bug

🕒 23 December 2015 | [Technology](#)

US Prison Bug

- More than 3,200 US prisoners have been released early because of a software glitch.
- The bug miscalculated the sentence reductions prisoners in Washington state had received for good behavior.
- Analysis of the errors showed that, on average, prisoners whose sentences were wrongly calculated got out 49 days early. One prisoner had his sentence cut by 600 days.
- An update that applies the correct formula for calculating sentence cuts is due to be placed by 7 January.

Hawaii Incident

- A test of “incoming nuclear bomb” message was accidentally distributed as a live message to citizens.
- A human error, but the software has been blamed for facilitating it.
- Requiring as little as 3 clicks either way, with the same UI
 - The interaction for test vs live is the same – with the same popups.
 - Depending on a user ‘noticing’ their error.

Ariane 5 Rockets

- “Ariane 5's first test flight (Ariane 5 Flight 501) on 4 June 1996 failed, with **the rocket self-destructing 37 seconds after launch because of a malfunction in the control software**. A data conversion from 64-bit floating point value to 16-bit signed integer value to be stored in a variable representing horizontal bias caused a precision error (operand error) because the floating-point value was too large to be represented by a 16-bit signed integer.
- The software was originally written for the Ariane 4 where efficiency concerns (the computer running the software had an 80% maximum workload requirement) led to four variables being protected with a handler while three others, including the horizontal bias variable, were left unprotected because it was thought that they were “physically limited or that there was a large margin of error”.
- The software, written in Ada, was included in the Ariane 5 through the reuse of an entire Ariane 4 subsystem despite the fact that the particular software contained a bug, which was just a part of the subsystem, was not required by the Ariane 5 because it has a different preparation sequence than the Ariane 4.”

Coding & Testing

Software Maintenance

Design & Test Planning

Change Maintenance

More Contemporary Example

- <https://twitter.com/allenholub/status/1145006228348657664?s=12>

The screenshot shows a Twitter interface with a sidebar on the left containing navigation options: Home, Explore, Notifications, Messages, Bookmarks, Lists, Profile, and More. A blue 'Tweet' button is at the bottom of the sidebar. The main content area displays a thread by Allen Holub (@allenholub) titled "Boeing's 737 MAX software outsourced to \$12.80-an-hour engineers" (with a link to smh.com.au/business/compa...). The tweet text reads: "You get what you pay for." Below the text is a photo of a Boeing 737 MAX aircraft. The tweet is retweeted by smh.com.au with a description: "Boeing's 737 MAX software outsourced to \$12.80-an-hour engineers. The software blamed for the Lion Air and Ethiopian Airlines disasters was developed at a time Boeing was laying off experienced engineers and cutting costs." The tweet is dated 5:28 PM · Jun 29, 2019. On the right, there is a 'Relevant people' section featuring Allen Holub (@allenholub) with a 'Follow' button. Below that is a 'United Kingdom trends' section listing trending topics: #MondayMotivation (48.5K Tweets), #HolocaustMemorialDay (trending with #HMD2020 and #standtogether), #Auschwitz75 (trending with Auschwitz-Birkenau, On the 75th), and #HolocaustRemembranceDay (trending with Primo Levi).

Top 10 SE Mistakes

1. Presume 'good code' is the only thing that matters.
2. Aim to finish at the delivery deadline.
3. Don't design a data model, let the code produce data it needs.
4. Use a Technical Lead that has never built a similar system, rather than choose/hire someone who has.
5. Hire forty developers to make coding go faster.
6. Build the system in the language you know best, rather than 'the best tool for the job'.
7. Hire a junior developer to handle the migration.
8. Skip the testing phase because the project is behind schedule.
9. Change code, without planning, to meet newly discovered requirements.
10. Buy a commercial, off-the-shelf package and customise it ... a lot.

Dorsey's Conclusions

1. Don't cut corners, methodologically. In the long run, this result in system failure or an inadequate system that doesn't meet the users' needs.
2. **Audit each major deliverable and step along the way for accuracy and correctness.**
3. Carefully monitor top management support for the project. Make sure that managers are aware of the progress of the team.
4. Secure the correct technical lead for the project.

“There is no free lunch in software engineering. If you insist on **keeping costs low** and **hurrying the project along**, then **quality will be low** or the **risk of failure will be high** no matter how well the project is managed.”

- Paul Dorsey

Overview of SE Process

Software Engineering Process

- Software engineering is an engineering discipline that is concerned with **all aspects** of software production.
- “Software engineering is concerned with *principles* and *methods* for *specifying, designing, implementing* and *maintaining* large software systems.” R.Sirewalt 2004
- Software engineers should adopt a **systematic and organized approach** to their work and **use appropriate tools** and techniques **depending on the problem** to be solved, the development constraints and the resources available.

Software Engineering Process

- You are not building something **for** yourself
 - you need to understand/agree what someone else wants
- You are not building something **by** yourself
 - you need to work with others - in different countries even
- You are not building it for people **like** yourself
 - it has to work for 'real humans', not computer experts
- You are not working on code you **wrote** yourself
 - you need to figure out how the hell is this stupid code working, who wrote this? an octopus? its the worst code I've ever seen. were they drunk? There's no comments.

Programming Wisdom
@CodeWisdom

Following

"Any code of your own that you haven't looked at for six or more months might as well have been written by someone else." - Eagleson's law

6:00 PM - 4 Jan 2019

Examples of SE Processes

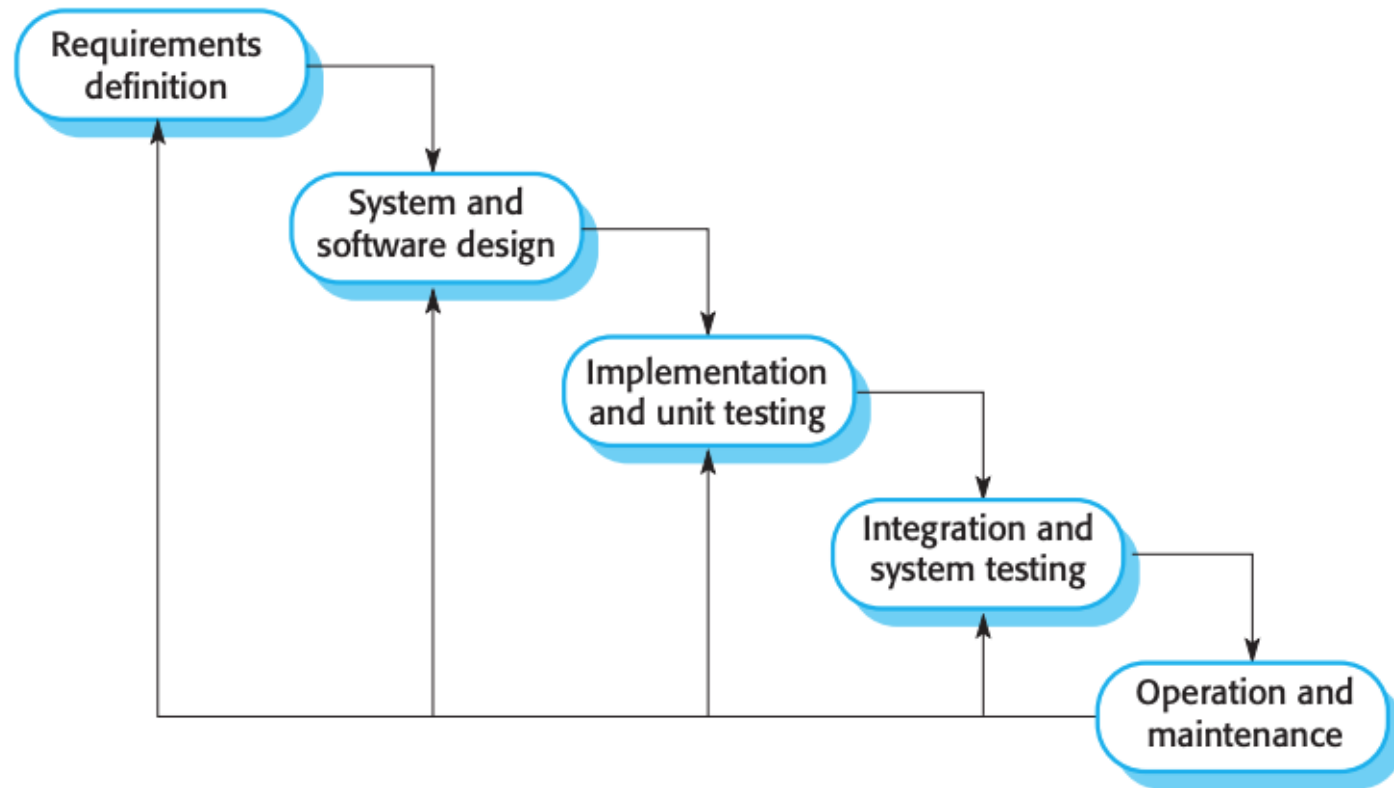

- This depends on what you are doing.
- Structured stages for large industrial projects.
- Flexible processes for small teams.
- Processes for international collaboration.
- However, they all have same kinds of activities in them.

Core SE Process Stages

- Generic activities in all software processes are:
 - **Specification** – what the system should do and its development constraints.
 - **Development** – production of the software system.
 - **Validation** – checking that the software is what the customer wants.
 - **Evolution** – changing code in response to demands.

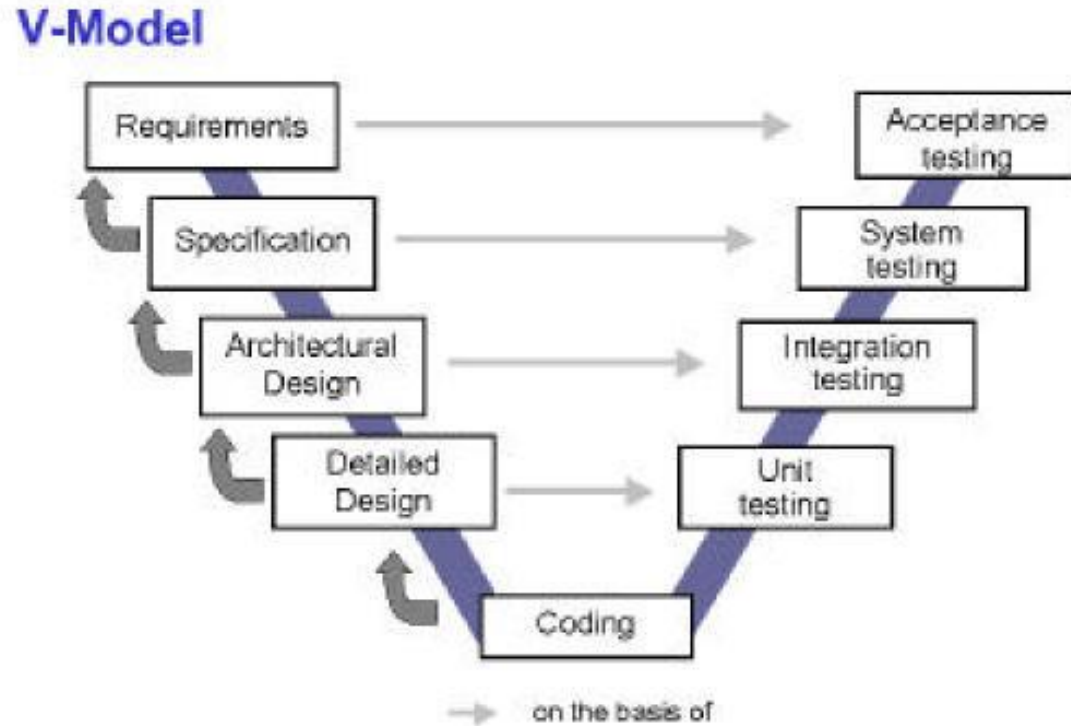

Waterfall Model

- Developed in 70s

V-Model

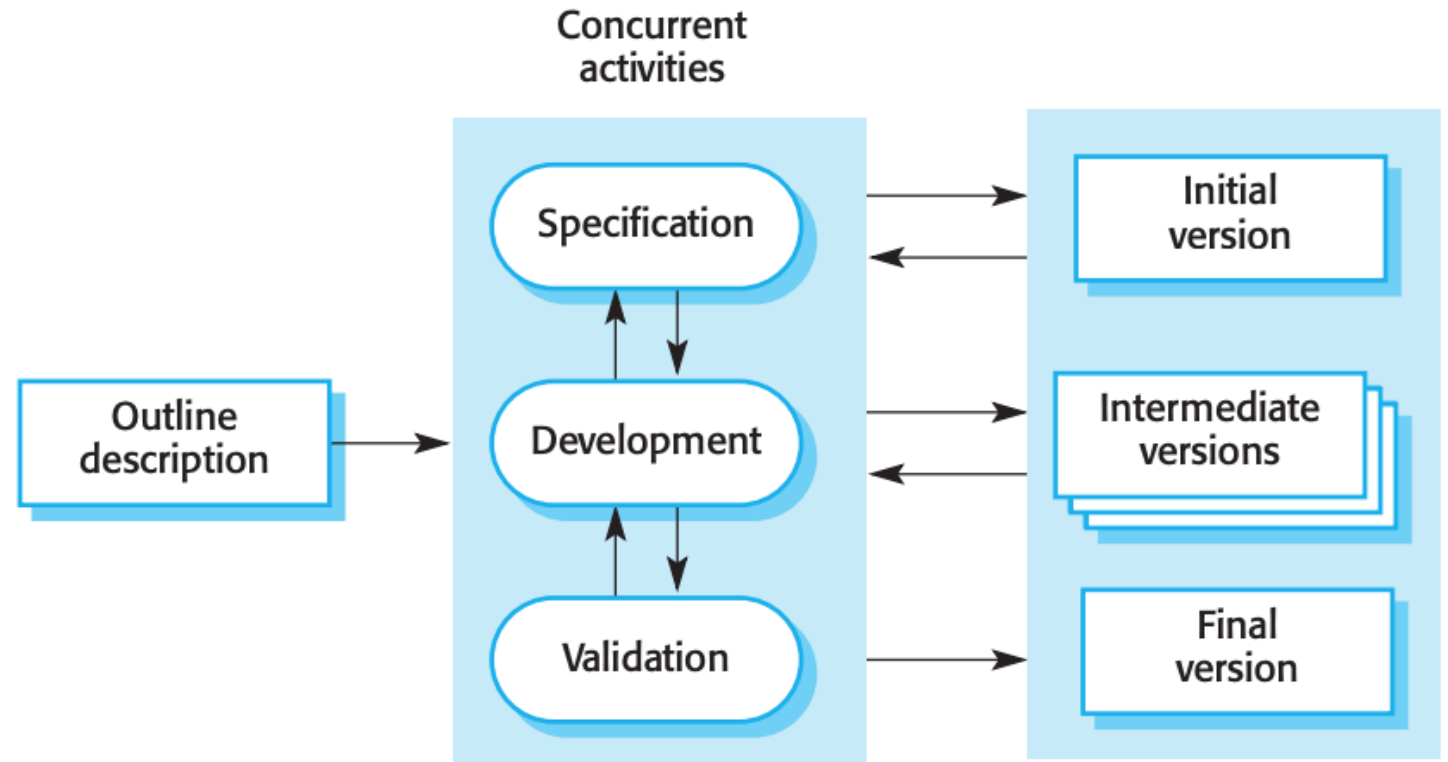

- [http://sqa.fyicenter.com/FAQ/Software-DevelopmentModels/Software Development Models V Model.html](http://sqa.fyicenter.com/FAQ/Software-DevelopmentModels/Software%20Development%20Models%20V%20Model.html)

Problems with Waterfall & V

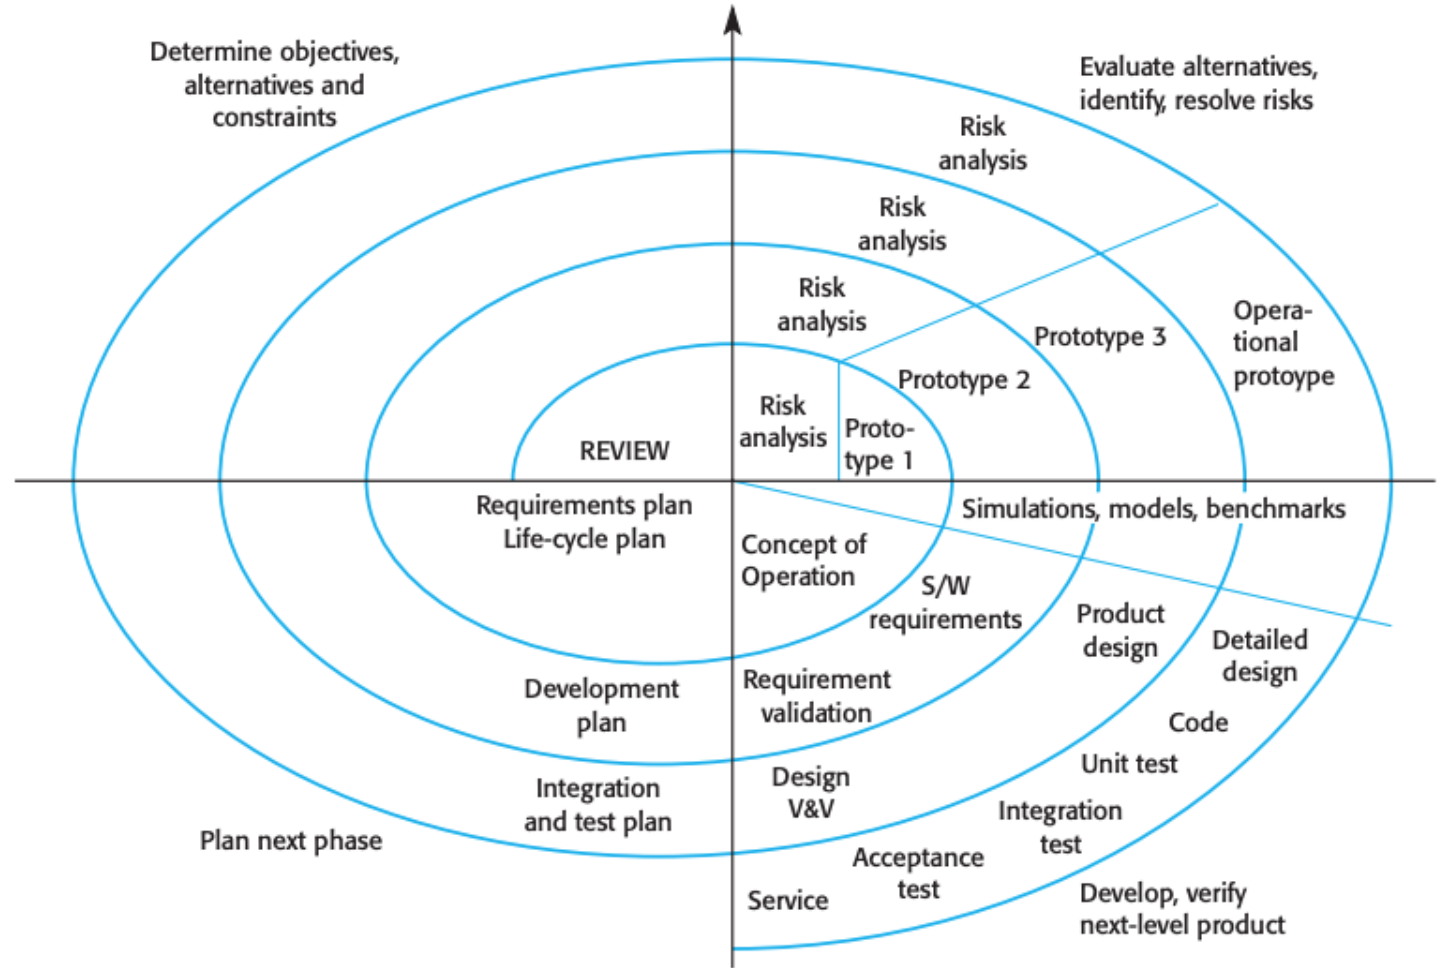

- Needs stable and “perfect” requirements.
- Can’t always anticipate what you are going to have to do.
- Does not account for revision or refactoring.
- Too inflexible and static.
- Depends on getting each stage exactly right
 - Changes can have many knock-on effects.

Iterative Model

Iterative Model – Boehm's Spiral

Developed in late 80s

Problems with Iterative Model

- Lack of process visibility.
 - Systems are often poorly structured.
- Too much doing and not enough planning.
- Special skills (e.g., in languages for rapid prototyping) may be required.
- Lightweight documentation taken to mean no documentation.

Effort in SE Processes

- 60% in designing and building the software.
- 40% in testing/delivering the software.
- BUT – Maintaining/Evolving software often costs **more** than producing it in the first place.

Why Do We Need SE Process?

1. Coding is one stage, out of e.g., 5 or more stages.
2. Having an appropriate SE Process/Methodology is really important.
3. Quality means getting the right process - and process right.
4. Quality means getting every stage done right, not fast.

Plan for the Module

SE Book

Lectures/Labs for Each Stage

CAL Week	SEM Week	Date	Lectures	Computing Labs
			Mon 09:00 - 11:00	Thu 09:00 - 11:00
24	2	20-Feb	Intro to SE, Using Git as a Team	Git and Markdown
25	3	27-Feb	Req Engineering & Gathering	Persona & Use Cases
26	4	06-Mar	Req Modelling & Validation	UML Diagram I
27	5	13-Mar	Specifications & Prototyping	UML Diagram II
28	6	20-Mar	OO Design, Test Plans & Debugging	CW1 (20%): Reqs & Specs
29	7	27-Mar	No Class	Invited Talk: Journey to GRP with Dave Towey
30	Mid	03-Apr	Types of Testing, JUnit Testing	JUnit
31	8	10-Apr	Continuous Integration	CW2 (30%): TDD Kickoff
32	9	17-Apr	Agile Methodologies & Software Quality	CW2 (30%): TDD I/O
33	10	24-Apr	Risk Management & Project Planning	PERT/Gantt Chart
34	11	01-May	Revision (Wed 14:00 - 15:00)	No Class
35		08-May	EXAM Week	

Labs & Assessments

- 50% Exam + 50% “Mixed Exercises”.
- 2-hours Lecture per week on **Monday at 9 am to 11 am** (except Week 7).
- 2-hours Lab session per week on **Thursday 9 am to 11 am**.
 - 8 Skill Labs – to prepare you for subsequent assessment.
 - First coursework – 20%.
 - Last 30% requires group coordination beyond the lab.

Teaching Distributions

- Dr. Boon Giin, Lee (Bryan)
 - **Email:** boon-giin.lee@Nottingham.edu.cn
 - **Office:** PMB-424
 - **Consultation Hours:** Tuesday @ 14:00 to 16:00
 - **Week:** 2 to 6 and revision
- Dr. Tianxiang Cui
 - **Email:** tianxiang.cui@nottingham.edu.cn
 - **Office:** PMB-426
 - **Consultation Hours:** Tuesday @ 14:00 to 16:00
 - **Week:** Mid to 10 and revision

What Type of
Learning are
We Doing in
this Module?

Why are We Working in Group?

Working in Group

- Software Engineering happens in groups.
 - 2nd year group project (GRP) is done in groups.
- You'll learn more by discussing these topics.
 - Because they are all about intellectual comprehension.
- Every lab is groupwork:
 - Peer-assess each others contribution, at end of each lab.
 - And your own contribution.

Working in Group

- Group of FIVE or SIX people.
- You can submit preferred/agreed teams to link in Moodle.
 - By **Wednesday 22nd Feb. 2023 at 12 pm.**
 - All remaining people will then be allocated to group(s).
- If less than FIVE or SIX, you will be topped up with additional group members.

Time Allocation

- 20 hours of lectures (including revision).
- 20 additional hours of extra reading (e.g. from the book).
- 20 hours for labs + 10 hours extra for last coursework.
- 10 hours of preparation for labs and peer making.
- 20 hours of revision & taking exam.

Using Moodle

- The schedule of classes is on Moodle.
- The lecture notes & lecture captures will be on Moodle.
- Q&A Forum for questions.
 - Moodle discussion forum.
 - Q&A via Microsoft Forms and Microsoft Teams.
- Coursework will be released on Moodle.
- We'll send notifications to you through Moodle.
- We'll be using Tencent Meeting for live Q&A during lecture and lab session.

Labs

- Labs are mandatory.
- There are tasks to prepare you for the assessment etc.
 - Sign up in groups.
- Moodle/Ms. Teams will reflect your teams.
 - You can see your team members in Moodle/Ms. Teams.
- Get all the groupmates before lab starts.
 - Attendance will be taken.

Using GitLab

- You will create a GitLab repository FOR YOUR GROUP.
- You will have a template repository forked in it. (Lab 01)
- All submitted work will be the group's work.
- We will mark based on your group's work.
- Your group repository is basically what you are “managing” for the semester.

THANK

YOU
